1. what is Javascript and its features?

Javascript is a scripting and Programing language used to make webPage Interedive and dynamic

1. JavaScript is used to create intterive web Page.
2. It is a lightweight and easy-to-learn Programing language.
3. It supports functions, objects and arrays
4. Its used for form validation and Dom manipulation
5. It support asynchronous Programming and event handling.

2. what is function and its types

* A function is a block of code used to perform a specific task. It helps us to reuse code and reduce repetition.

1. Named function -> function with a name
2. Anonymous function -> A function without a name
3. Arrow Function -> A function with arrow syntax
4. call backfunction -> A function passed as an argument to another function
5. Higher order function -> A function that accepts or returns another function

3 what is spread operator when do we use it.

* The spread operator is represented by three dots (...). It used to expand element of an array or object.

1. It is used to copy an array
2. It is used to merge two or more array
3. It is used to copy an object
4. It is used to merge two object
5. It is used to pass array elements as functio argument.

4. what is React and its features?

* React is a Java script library used to build user interfaces. Its is mainly used to create single-Page application.

1. Reeact is used to build interactive user interface
2. It uses reusable Components
3. It uses virtual Dom for efficiant UI updates
4. It supports JSX to write HTML-like code
5. It Provide Hooks to manage State and and other feature

5. what is JSX? Difference between Js and JSX?

* JSX stand for Javascript XML. It allows us to to write HTML like code inside Javascript

	Javascript	JSX
1.	Programming language	Syntax extension
2.	uses Javascript Syntax	Uses HTML-like Syntax
3	Used for Programming logic	used to describe UI

6. what is Event? list out Event names.

* As event is an action performed by to user on a webpage.

Event names :-

1. onClick
2. onChange
3. onSubmit
4. onmouseout
5. on mouse over
6. on key Down
7. On Focus
8. onBlur

7. what are components and their types? Explain import and Export.

* A component is a reusable part of a React application It help us divide the UI into small part.

Types:

1. Fuctinal component
2. Class component.

import : used to acces components from another file

Export : used to share components with other files

8. what is Rendering and its types?

* Rendering is the process of the displaying UI on screen.

important Rendering concepts:

1. initial Rendering - Display the componnt for the fist time
2. Re - Rendering - update the component whe state or Props change
3. Conditional Rendering - Display UI based on a Condition
4. List Rendering - Display multiple items using the map ( ) method.

9. What are Hooks?

* Hooks are special function in React that allow us to use state and other React feaures in functional components.

important Hooks.

usestate -> used to manage state in component

useEffect -> used to handle side effects

use context -> used to share data between component

useRef -> used to access Dom elements and store values

use memo -> used to optimize Performance by remembering calculated values

Other Hook : useCallback

10. what is state and PROPS?

State -:

* state used to store and manage data inside a React component

1. State store compent data
2. It is managed inside the component
3. we can update state using the setter function.
4. when state change React re-renders the component.
5. State is create using the usestate Hook.

Props -:

Props are used to pass data from a parent component to child component.

1. Props are used to pass data between components
2. They are passed from parent to child
3. Props are red-only
4. They help us create reuable components
5. Props can pass string numbers, arrays and function.
